

ROUTING IN MVC

- Routing maps the incoming browser requests to particular MVC controller actions, Routing table contains all available routes based on controller and action
- Route defines the URL pattern and handler information. All the configured routes are stored in RouteTable and will be used by the Routing engine to determine appropriate handler class or file for an incoming request.

SYNTAX

```
public static void RegisterRoutes(RouteCollection routes)
{
    routes.IgnoreRoute("{resource}.axd/{*pathInfo}");

    routes.MapRoute(
        "Default",                                     // Route name
        "{controller}/{action}/{id}",                 //URL with parameters
        new { controller = "Home", action = "Index", id = "" } //Parameter defaults
    );
}
```
